

1 Summary

Word limit: 550

In plain English, provide a summary we can use to identify the most suitable experts to assess your application.

We usually make this summary publicly available on external-facing websites, therefore do not include any confidential or sensitive information. Make it suitable for a variety of readers, for example:

- opinion-formers
- policymakers
- the public
- the wider research community

Guidance for writing a summary Clearly describe your proposed work in terms of:

- context
- the challenge the project addresses
- aims and objectives
- potential applications and benefits
- its relevance to the BBSRC long-term research and innovation priorities and, if applicable Responsive Mode Spotlight areas

20 **2 Core team**

21 List the key members of your team and assign them roles from the following:

- 22 • project lead (PL)
- 23 • project co-lead (UK) (PcL)
- 24 • specialist
- 25 • professional enabling staff
- 26 • research and innovation associate
- 27 • technician
- 28 • researcher co-lead (RcL)

29 Only list one individual as project lead.

30 UKRI has introduced a new addition to the ‘specialist’ role type. Public
31 contributors such as people with lived experience can now be added to an
32 application.

33 Find out more about [UKRI’s core team roles in funding applications and](#)
34 [our eligibility guidance](#).

3 Application questions

3.1 BBSRC schemes

Word limit: 1

Indicate the scheme through which you are applying.

In the text box, copy the number corresponding to the scheme you are applying through. These are:

1. standard (no scheme)
2. Industrial Partnership Award (IPA)
3. LINK
4. Brazil (FAPESP)
5. Luxembourg (FNR)
6. NSF-Bio

Additional guidance

This is for administrative purposes to help the initial application processing.

Please follow the scheme specific guidance below and upload the additional documents listed as a single PDF no larger than 8MB:

IPA or LINK:

- a letter from your institution's technology transfer office outlining the management of outputs from the proposed research

FAPESP:

- FAPESP proposal form
- FAPESP consolidated budget form
- FAPESP letter of eligibility

FNR:

60 • CVs of international collaborators

61 • FNR ‘INTER’ budget form

62 • FNR ‘INTER’ cost justification

63 NSF-Bio:

64 • US biosketches

65 • US budget forms

66 **3.2 BBSRC remit classification**

67 Word limit: 1

68 Your application will be considered by one of our four research committees
69 made up of independent experts. Indicate which you feel would be best placed
70 to assess your application.

71 In the text box, write only the letter (in uppercase) corresponding to the
72 committee you feel would be best placed to assess your application. These
73 are:

74 **A** animal disease, health and welfare

75 **B** plants, microbes, food and sustainability

76 **C** genes, development, and science, technology, engineering and maths (STEM)
77 approaches to biology

78 **D** molecules, cells and industrial biotechnology

79 Additional guidance:

80 This is for administrative purposes to help the initial application pro-
81 cessing. We will check your choice and make a final decision as to which
82 committee will assess your application.

83 3.3 Vision

84 Word limit: 550

85 What are you hoping to achieve with your proposed work?

86 What the assessors are looking for in your response

87 Explain how your proposed work:

- 88 1. is of excellent quality and importance within or beyond the field(s) or
89 area(s)
- 90 2. has the potential to advance current understanding, or generate new
91 knowledge, thinking or discovery within or beyond the field or area
- 92 3. is timely given current trends, context, and needs
- 93 4. impacts world-leading research, society, the economy, or the environ-
94 ment

95 You may demonstrate elements of your responses in visual form if rele-
96 vant. Further details are provided in the Funding Service. References may
97 be included within this section.

98 3.3.1 Context

99 Conventional systems neuroscience experiments are typically short in dura-
100 tion and often place significant constraints on subjects behaviours to simplify
101 data analysis. However, these restrictions may limit our ability to observe
102 critical aspects of brain function and behaviour that only manifest in more
103 naturalistic and extended conditions.

104 At the Sainsbury Wellcome Centre (SWC) and Gatsby Computational
105 Neuroscience Unit (GCNU) we are pioneering **Naturalistic, Long-Duration,**
106 **and Continual (NaLoDuCo) experiments** in mice that span weeks to
107 months. During these experiments, we collect high-resolution behavioural
108 and neural recordings in naturalistic settings (Figure 1).

109 To support this endeavor, we are developing the **AEON platform**, an
110 innovative set of hardware and software tools for NaLoDuCo experimen-
111 tal control, data store and access. We are using this platform to investi-
112 gate the neural basis of foraging behavior in mice over prolonged periods of
113 time (Campagner et al., 2024).

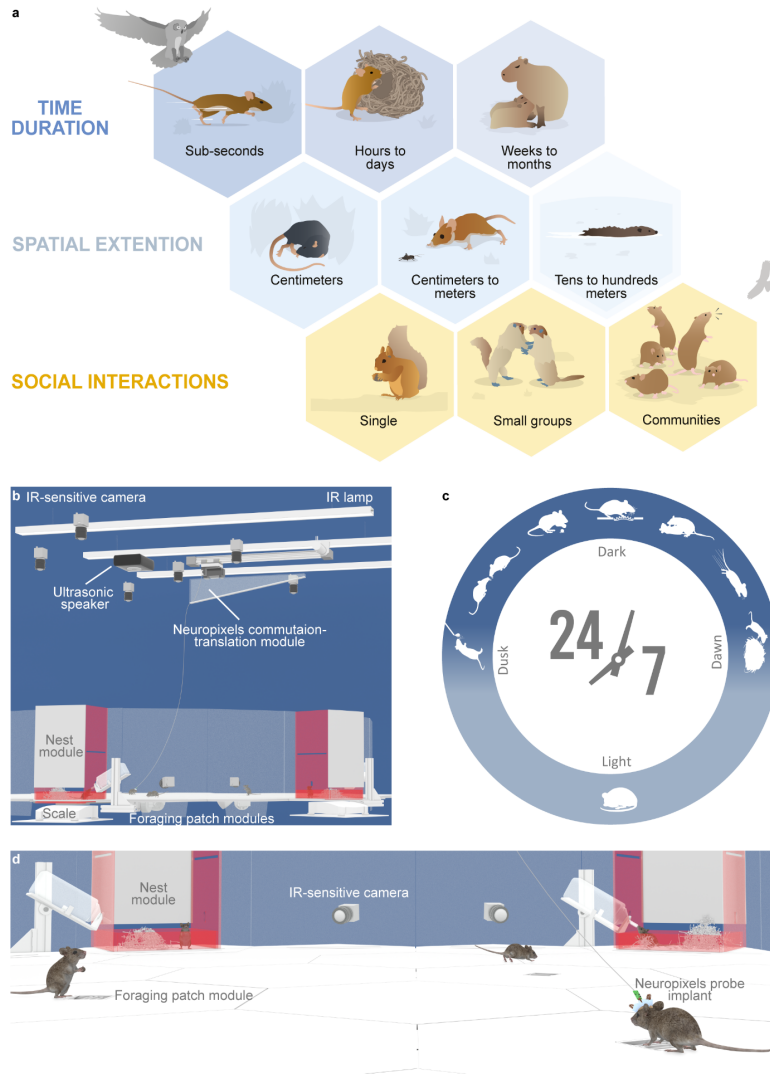

Figure 1: **a**: Example of natural behaviours in rodents that take place over different timescale, spatial extensions and involving different numbers of individuals.

b-d: Close-up views of one possible configuration of the Aeon environment in which naïve mice and mice chronically implanted with Neuropixels probe can live while expressing a variety of natural behaviours including exploring, drinking, escaping, foraging, nesting, sleeping, eating and interacting socially.

114 Our US partner, the **Allen Institute for Neural Dynamics (AIND)**
115 is also performing NaLoDuCo experimentation, using the AEON platform,
116 studying naturalistic olfactory learning over weeks to month outside conven-
117 tional task structures (Fink et al., 2024).

118 **NeuroGEARS Ltd**, our industrial partner, is a UK-based company sup-
119 porting academic institutions implementing innovative technology for scien-
120 tific investigation. It is the main developer of the **Bonsai** software ecosystem
121 for experimental control (Lopes et al., 2015), used by thousands of scientists
122 around the world, and powering the AEON platform. NeuroGEARS has
123 played a central role in the development of the AEON platform, and pro-
124 vides services to both the SWC and the AIND.

125 NaLoDuCo experimentation will enable researchers to explore neural mech-
126 anisms underlying ethological behaviours in naturalistic environments over
127 months, for the first time. The experiments will shed new light on a wide
128 range of poorly understood neural mechanisms, including how the brain
129 structures complex behavioural sequences as a function of the animal needs,
130 learning, adaptation, sleep-dependent memory consolidation and social dy-
131 namics. **The data generated from NaLoDuCo experiments represent**
132 **an entirely new resource in neuroscience**, with the potential to drive
133 breakthroughs and discoveries that are beyond the reach of traditional ex-
134 periments.

135 While **naturalistic, long-duration, or continuous** neuroscience ex-
136 periments have been conducted in the past (Nagy et al., 2023; Ho et al.,
137 2023; Ray et al., 2025; Weissbrod et al., 2013; Dhawale et al., 2017; Newman
138 et al., 2024), to the best of our knowledge, **we are the first ones to inte-**
139 **grate all three of these features in a single experimental paradigm.**

140 This emerging paradigm of long-duration experimentation is poised to
141 become mainstream in the coming years. However, experiments spanning
142 weeks to months generate massive datasets—often reaching hundreds of ter-
143 abytes—posing significant challenges in data acquisition, management, distri-
144 bution, visualization, and analysis. To address these challenges, we (GCNU,
145 SWC, AIND, and NeuroGEARS Ltd) will collaboratively extend the AEON
146 platform with functionality to **visualise and statistically analyze pre-**
147 **viously collected NaLoDuCo experimental data on the cloud**, and
148 **to perform real-time machine to enable the intelligent control of**
149 **NaLoDuCo experiments.**

3.3.2 Specific aims

Data generated by NaLoDuCo experiments will be of general interest to the neuroscience community. **We want to share our NaLoDuCo foraging and odor learning recordings and allow other groups collecting this type of data to share their own.** However, this dissemination is not trivial, as datasets are of the order of hundreds of terabytes, and it will take users several days to download them over standard Internet connections.

Instead of bringing data to users, we will bring users to data, by storing datasets in the cloud (or in institutional clusters), and providing **cloud software to allow users to visually explore and statistically analyse behavioural and neural NaLoDuCo datasets where they live** (1 and 2 in Figure 2).

Our statistical analysis of neural time series will require knowledge of the spiking activity of single units; i.e., spike sorting. In long-duration experiments with freely moving animals spike sorting is a challenging problem, because movements of recording probes change the shape of spike waveforms over time and complicate the assignment of spikes to units based on their waveforms. We will address this problem by developing **spike sorting methods for long-duration, continual and high-channel-count recordings** (3 in Figure 2).

Funded by a BBSRC award we are adding machine learning functionality to Bonsai in order to enable a new type of experimentation controlled by advanced machine learning inference on behavioral and neural recordings (Bonsai.ML, [Guilbeault et al., 2025](#)). We have developed this functionality for conventional short duration experiments. We will add to Bonsai.ML **real-time machine learning functionality for processing nonstationary data**, such as that generated in NaLoDuCo experiments.

Most of the online neural data analysis methods that we will add to AEON require sorted spikes. We will adapt the previous offline **spike sorting methods for long-duration experiment to operate in real-time** (5 in Figure 2).

223 3.4 Approach

224 Word limit: 3,300

225 How are you going to deliver your proposed work?

226 What the assessors are looking for in your response

227 Explain how you have designed your approach so that it:

- 228 1. is effective and appropriate to achieve your objectives
- 229 2. is feasible, and comprehensively identifies any risks to delivery and how
230 they will be managed
- 231 3. uses a clearly written and transparent methodology (if applicable)
- 232 4. summarises the previous work and describes how this will be built upon
233 and progressed (if applicable)
- 234 5. will maximise translation of outputs into outcomes and impacts
- 235 6. describes how your, and if applicable your team's, research environment
236 (in terms of the place and relevance to the project) will contribute to
237 the success of the work

238 You may demonstrate elements of your responses in visual form if rele-
239 vant.

240 Please make sure to check sizing and readability of the image using 'read
241 view' prior to submission. Further details are provided in the Funding Ser-
242 vice.

243 References may be included within this section.

244 Within the 'Approach' section we also expect you to:

- 245 • provide a detailed and comprehensive project plan including milestones
246 and timelines in the form of an embedded Gantt chart or similar (please
247 make sure to check sizing and readability of the image using 'read view'
248 prior to submission)

249 BBSRC's [action plan for EDI](#) outlines our commitment to removing bar-
250 riers to participation in our programmes, ensuring investments do not inad-
251 vertently prevent access or usage by individuals from minority groups, for
252 example disabled researchers.

253 To this end, applications should identify how accessibility and inclusive-
254 ness in the widest sense have been incorporated into the design of the project.
255 For example, you may wish to reference relevant institutional strategies and
256 policies which support equality, diversity, and inclusion as they relate to ac-
257 cess to equipment and facilities and indicate how the proposed project has
258 been designed and will be delivered with broad access in mind.

259 We have collected unprecedented NaLoDuCo datasets at the SWC and
260 AIND, comprising continuous, multimodal recordings over weeks to months.
261 However, the scientific value of these massive datasets cannot be fully realized
262 without robust tools for visual exploration and analysis. To address this need,
263 we will develop and disseminate an open-source library of methods for the
264 visualization and analysis of NaLoDuCo experimental data.

265 This library will include tools for both offline and online analysis (Sec-
266 tions 3.4.1 and 3.4.2), visual exploration (Section 3.4.3), and scalable offline
267 and real-time spike sorting (Sections 3.4.4 and 3.4.5). Together, these meth-
268 ods will make NaLoDuCo data more accessible, interpretable, and actionable
269 for the neuroscience community.

270 3.4.1 Offline Analysis Methods

271 **Modern neuroscience lacks robust methods to characterize long-**
272 **duration and continual time series**, especially in settings where the sta-
273 tistical properties of the data evolve over time. This limitation present a
274 methodological gap that must be addressed in order to unlock the scientific
275 potential of NaLoDuCo experiments.

276 To bridge this gap, we will develop and disseminate a software library
277 containing new implementations of machine learning methods specifically
278 tailored to: (1) operate effectively under **non-stationary** conditions, and
279 (2) scale to **very long time series**.

280 3.4.1.1 Initial List of Methods to Include in the Library

281 We will initially populate this library with new implementations of methods
282 already in use at the GCNU, SWC, and AIND to analyze neural and behav-
283 ioral time series from NaLoDuCo foraging and olfactory learning experiments
284 in mice. These methods span multiple domains—kinematics, neural dynam-
285 ics, behavioral state segmentation, forecasting, and joint modeling—and are

286 designed to work together within an integrated analysis pipeline. We de-
287 scribed these methods below and summarise them in Table 1.

288 **Behavioral Analysis:** The first step in behavioral analysis involves multi-
289 body-part tracking. For this, we will use **deep learning-based pose esti-**
290 **mation** methods such as **SLEAP**, which enable accurate and efficient track-
291 ing of multiple unmarked mice across long recording sessions.

292 From the tracked poses, we will infer continuous kinematic variables using
293 **linear dynamical systems (LDS)**, including particle filter-based variants
294 to handle uncertainty and measurement noise. These kinematic features will
295 be used to infer discrete behavioral states with **Hidden Markov Models**
296 **(HMMs)**, as implemented in tools such as **MoSeq**.

297 We will relate these inferred states and kinematic variables to foraging-
298 related outcomes—such as patch-leaving decisions—using both **generalized**
299 **linear models (GLMs)** and **deep neural networks**. These models will
300 allow us to capture both interpretable and high-capacity representations of
301 behavioral decision-making processes.

302 To recover the latent strategies guiding animal behavior, we will apply
303 **inverse reinforcement learning** methods such as **HIQL**, which estimate
304 the underlying reward functions and policies based on observed actions.

305 NaLoDuCo recordings uniquely support behavioral forecasting over ex-
306 tended horizons—ranging from hours to days—far beyond what is feasible
307 in conventional short-duration experiments. To capitalize on this, we will
308 apply long-horizon forecasting models using **recurrent neural networks**
309 **(RNNs)** and **transformer architectures**, which are well-suited to model-
310 ing long-range temporal dependencies.

311 **Neural Data Analysis:** Analysis of high-density electrophysiology will be-
312 gin with **latent variable modeling** to reduce the dimensionality of popula-
313 tion neural recordings. We will use both linear and nonlinear latent dynamics
314 models, including **svGPFA**, which uses Gaussian processes, and **LFADS**, a
315 deep generative model based on recurrent neural networks.

316 The resulting low-dimensional trajectories will be used to infer discrete
317 neural states via **HMMs**, using methods such as **SSM**. For neural activity
318 forecasting across long durations, we will again employ **RNNs** and **trans-**
319 **formers**, which can model complex temporal structure in spiking activity.

320 We will also decode the animal’s position from hippocampal spike trains
321 using **point-process decoders**, enabling the analysis of spatial coding and

322 replay phenomena during naturalistic foraging behavior. We will build on
323 existing implementations such as [replay_trajectory_classification](#).

324 **Joint Neural-Behavioral Modeling:** To understand the interactions be-
325 tween neural dynamics and behavior, we will use models that extract **shared**
326 **latent representations** from both domains. These models will help reveal
327 how cognitive and behavioral states are jointly encoded in neural activity.

328 We will adapt [Recognition-Parametrized Models \(RPM\)](#), a Bayesian ap-
329 proach developed at the GCNU, which infers latent variables that explain
330 multiple observation streams through highly nonlinear relationships. We
331 will also use [CEBRA](#), a state-of-the-art contrastive learning framework de-
332 signed for multimodal representation learning, to discover temporally and
333 semantically aligned neural-behavioral structure.

334 3.4.1.2 Non-stationarity

335 Many conventional methods for analyzing neural and behavioral time series
336 assume that the underlying data-generating processes are stationary—that
337 is, their statistical properties remain constant over time. While this assump-
338 tion may be acceptable in short-duration experiments, it breaks down in
339 long-duration and continual recordings. In such settings, animals learn and
340 adapt, their internal states and motivations fluctuate, and their behavior and
341 physiology are influenced by biological rhythms such as circadian, ultradian,
342 and infradian cycles. These changes induce non-stationarity in the data,
343 making models that assume stationarity progressively less reliable or even
344 obsolete.

345 To address this challenge, we will adapt and develop methods that are
346 explicitly designed to operate in non-stationary environments. Our approach
347 draws on techniques from multiple domains, including adaptive signal pro-
348 cessing, machine learning, and Bayesian inference.

349 **Adaptive Signal Processing.** The field of adaptive signal processing has
350 produced robust methods for modeling linear systems with time-varying dy-
351 namics ([Haykin, 2002](#)). The recursive least-squares (RLS) algorithm, for
352 example, is a well-known adaptation of the ordinary least squares algorithm
353 that continuously updates model parameters to perform linear regression
354 under non-stationary conditions. We will use RLS to study time-varying re-
355 lations between behavioral states, as inferred by hidden Markov models, and

Table 1: Initial data analysis methods to disseminate

Domain	Functionality	Method	Model Type
behaviour	multi-body-part tracking	SLEAP	deep neural network
behaviour	kinematics inference	LDS	linear dynamical system
behaviour	kinematics inference	LDS	particle filter
behaviour	state inference	SSM	hidden Markov model
behaviour	regression		generalized linear model
behaviour	regression		deep neural network
behaviour	policy inference	L(M)V-IQL	reinforcement learning
behaviour	long-duration forecasting		RNN
behaviour	long-duration forecasting		transformers
brain	latents inference	svGPFA	Gaussian processes
brain	latents inference	LFADS	RNN
brain	state inference	SSM	hidden Markov model
brain	long-duration forecasting		RNN
brain	long-duration forecasting		transformers
brain	decoding	NA	point-process decoder
brain & behaviour	latents inference	RPM	Bayesian inference + deep neural network
brain & behaviour	latents inference	CEBRA	contrastive learning

356 foraging visit durations.

357 **Continual Learning.** The field of continual learning develops adaptive
358 methods for artificial neural networks. In classic continual learning, a model
359 learns a sequence of discrete, well-defined tasks. But in NaLoDuCo experi-
360 mentation, as in many real-world settings there are not specific task bound-
361 aries. So methods that do not require task boundaries are needed. They are
362 studied by the subfield of task-free continual learning and include online regu-
363 larization (which constrain the update of relevant weights), experience replay
364 (which maintain a small, representative buffer of past samples) and ensemble
365 methods (which combine the predictions of multiple individual models
366 with, for example, different learning rates). We will use these techniques, for
367 example, to train pose tracking models on month-long continuous recordings.

368 **Adaptive State-Space Models.** In state-space modeling, the Kalman
369 filter provides a principled way to handle non-stationary Gaussian processes
370 with drifting mean and covariance. More flexible approaches are needed when
371 data exhibit abrupt regime shifts or complex latent dynamics. Switching
372 state-space models, such as Switching Linear Dynamical Systems (SLDS)
373 and Switching Hidden Markov Models (sHMMs), model discrete changes in
374 underlying system dynamics. For nonlinear, non-Gaussian signals, particle
375 filters approximate the posterior distribution through sequential sampling.
376 Bayesian online learning techniques offer a general framework for continually
377 updating model parameters as new data arrive. Using these techniques we
378 will build models that robustly infer kinematics over months.

379 **Concept Drift in Machine Learning.** In the machine learning litera-
380 ture, non-stationarity is often framed under the concept of *concept drift*,
381 which refers to changes in the joint distribution of inputs and outputs over
382 time. Such drift can take various forms—sudden, gradual, or cyclical (e.g., re-
383 emergence of behavioral patterns linked to circadian or ultradian rhythms).

384 Techniques for handling concept drift generally fall into three categories:
385 (1) *detection methods*, which monitor for significant changes in data distri-
386 bution; (2) *adaptation methods*, which incrementally update models using
387 strategies such as sliding windows, online learning, or ensemble-based ap-
388 proaches; and (3) *forgetting mechanisms*, which allow models to discard out-
389 dated information while retaining relevant past knowledge.

390 We will apply techniques from the concept drift literature to models that
391 fall outside the previous categories of focus (e.g., linear models, artificial
392 neural networks, and state-space models). In particular, we will explore their
393 use in building **Recognition-Parametrized Models (RPMs)** to estimate joint
394 behavioral and neural latent variables over timescales of weeks to months.

395 In summary, robust analysis of NaLoDuCo datasets requires models that
396 continuously adapt to evolving data distributions. Our offline analysis frame-
397 work will integrate both established adaptive algorithms and cutting-edge
398 methods from continual learning and concept drift to meet this challenge.

399 **3.4.1.3 Computational efficiency**

400 Neural and behavioral data analysis is most effective when computations
401 are performed quickly, ideally in real time. Slow computations discourage
402 data exploration and hinder scientific discovery. The large dataset sizes gen-
403 erated by NaLoDuCo experimentation pose a significant challenge for fast
404 data analysis.

405 To overcome this limitation, we will combine distributed and GPU com-
406 puting. Distributed computing is a paradigm in which tasks and data are
407 divided across multiple computers. Instead of relying on a single powerful
408 machine, distributed computing accelerates processing by executing multiple
409 parts of a computation in parallel. GPU computing is a parallel computing
410 approach that uses Graphics Processing Units (GPUs) to accelerate compu-
411 tational tasks. Unlike traditional Central Processing Units (CPUs), which
412 execute a few complex operations sequentially, GPUs consist of thousands
413 of smaller cores optimized for executing many operations simultaneously.
414 Distributed computing allows to split workload across multiple machines,
415 overcoming memory and computational limitations. It is particularly useful
416 for scaling to massive datasets.

417 For distributed computing to deliver substantial speed improvements,
418 computations must be decomposable into independent parallel tasks. Due to
419 their serial dependencies, time series models are difficult to decomposed in
420 this manner. Still, time series models can benefit from distributed comput-
421 ing infrastructures, as many parts of time series pipelines are parallelizable,
422 like preprocessing steps (e.g., filtering, feature extraction, normalization) or
423 parallel model evaluation across hyperparameter sweeps. In addition, when
424 datasets are too large to fit in memory, distributed computing (e.g., with
425 Ray, Dask, or Spark) can Distribute I/O and preprocessing, train models in

426 parallel on different subsets (e.g., one model per animal or time window) and
427 run hyperparameter sweeps or model variants in parallel. Furthermore, even
428 with serial dependencies GPU acceleration significantly speeds up the pro-
429 cessing of each item in the time series, specially when large matrix operation
430 are involved.

431 We will develop accelerated implementations of all methods in the library.
432 These implementations will use **JAX** for model learning, inference, and nu-
433 merical computation, **Apache Spark** or **Dask** to distribute pre-processing and
434 feature extraction, and **Ray** to distribute machine learning and deep learning
435 functionality.

436 Related to this item is the library **Thunder**, which accelerate the anal-
437 ysis of large scale neural data. It was pioneering by introducing the use
438 of distributed computing in neural data analysis. Our library is different
439 from **Thunder** in that, besides analyzing large scale neural data, it processes
440 continual recordings, and needs to overcome non-stationarity problems. In
441 addition, **Thunder** implements simpler methods assuming independent and
442 identically distributed data, while our library contains more sophisticated
443 time series ones.

444 **3.4.1.4 Outputs**

- 445 1. repository containing implementations of machine learning algorithms
446 for offline processing NaLoDuCo experimental data, adapted to op-
447 erate in non-stationary environments, and optimized to perform at
448 scale when running on public clouds or institutional high-performance-
449 computing clusters.
- 450 2. SWC NaLoDuCo foraging dataset stored in DANDI.
- 451 3. deployment of the methods in 1 in Amazon EC2 instances, to allow
452 users to analyze on the cloud the datasets in 2.

453 **3.4.2 Online Machine Learning**

454 **3.4.2.1 Outputs**

- 455 1. Bonsai packages implementing real-time ML functionality for experimetal
456 control
- 457 2. Documentation of these packages

458 3.4.3 Visual Exploration

459 Visualizations are essential for extracting insight from any dataset. Given
460 the scale of NaLoDuCo datasets, downloading them locally is impractical.
461 Therefore, visualization methods must operate where the data resides—either
462 in the cloud or on institutional compute clusters.

463 We will develop visualization functionality for both continuous datasets
464 (Section 3.4.3.1) and epoched datasets, where epochs are anchored around
465 events identified by advanced machine learning methods (Section ??).

466 3.4.3.1 Continuous Visualizations

467 Continuous visualizations will enable users to seamlessly explore large-scale
468 behavioral and neural datasets spanning weeks to months. Users should
469 be able to fluidly zoom out to gain a high-level overview (e.g., across an
470 entire month) and zoom in to inspect millisecond-level detail. Our goal is
471 to provide an interactive experience analogous to Google Maps—where one
472 can zoom from a global perspective down to individual buildings—with time
473 series data.

474 To achieve this, we will employ a combination of tiling, hierarchical stor-
475 age, and streaming techniques:

476 Multi-Resolution Tiling.

- 477 • Large volumetric and time series datasets will be preprocessed into tiles
478 at multiple spatial and temporal resolutions.
- 479 • When the user zooms into a specific time or spatial window, only the
480 relevant tiles at the appropriate resolution will be rendered, minimizing
481 latency and resource use.

482 Hierarchical Storage.

- 483 • Data will be organized using hierarchical file formats (e.g., Zarr, HDF5)
484 that support chunked access and multi-resolution storage.
- 485 • These formats allow efficient random access to specific subsets of data
486 and integration with modern data infrastructure.

487 **On-Demand Streaming.**

- 488 • Visualizations will stream data dynamically based on the user’s current
489 view, leveraging cloud infrastructure to deliver data at the required
490 resolution and scale.
- 491 • We will develop custom APIs for real-time access and transformation
492 of neural and behavioral data streams.

493 **3.4.3.2 Epoched and Interactive Visual Analytics**

494 A key strength of our platform is its support for **epoched visualization**
495 **and interactive, closed-loop visual analytics**, which together enable the
496 discovery and refinement of neural and behavioral patterns in long-duration
497 datasets.

498 Epoched visualizations are essential for analyzing data around events of
499 interest—such as decision points, sensory cues, or machine learning-inferred
500 transitions. These visualizations will support:

- 501 • Grouping trials or epochs by event type, time of day, or machine
502 learning-inferred state
- 503 • Overlaying neural, behavioral, and environmental variables aligned to
504 key event markers
- 505 • Flexible sorting and filtering of epochs to uncover context-dependent
506 patterns

507 We will implement interactive interfaces that allow researchers to define,
508 explore, and compare arbitrary epoch-based segments. These will support
509 exploratory data analysis as well as hypothesis-driven comparisons across
510 conditions, individuals, and time periods.

511 **Machine Learning-Defined Events.** A core feature of our system will be
512 the ability to align epochs not just to experimenter-defined events, but also
513 to latent state transitions inferred via unsupervised methods (e.g., hidden
514 Markov models, behavioral clustering, inverse reinforcement learning). This
515 will support deeper investigation into emergent patterns in long-duration,
516 naturalistic behavior.

517 **Closed-Loop Analytics.** There will be a *closed-loop interaction* between
518 visualizations and machine learning algorithms: algorithmic outputs will gen-
519 erate new visualizations, and visual insights will guide further machine learn-
520 ing analysis, forming an iterative discovery cycle. This process allows the
521 visualization platform to function not just as a display tool, but as a central
522 component in data-driven scientific inquiry.

523 In this loop:

- 524 • **Machine learning algorithms** extract latent states, classify behav-
525 iors, infer structure, or forecast dynamics from NaLoDuCo data.
- 526 • These outputs feed into the visualization engine to generate novel views
527 (e.g., state-aligned rasters, dynamic embeddings, attention maps).
- 528 • **Users explore these visualizations interactively**, discovering un-
529 expected, task-agnostic, or contextual patterns.
- 530 • New queries and insights drive further rounds of machine learning anal-
531 ysis—closing the loop.

532 This design enables researchers to co-develop computational models and
533 scientific hypotheses iteratively, with human insight and machine inference
534 deeply intertwined.

535 3.4.3.3 Software Stack for Interactive Visualizations

536 To support scalable, cloud-based, and interactive visualization of NaLoDuCo
537 datasets, we will develop our system using a modern and modular software
538 stack optimized for high performance, extensibility, and ease of integration
539 with existing neuroscience infrastructure.

540 Frontend (User Interface).

- 541 • **React.js** will serve as the primary framework for building a dynamic,
542 modular, and responsive web-based interface.
- 543 • Visualization components will leverage libraries such as **D3.js**, **Plotly**,
544 and **Deck.gl** to render interactive time series, raster plots, and behav-
545 ioral trajectories at scale.
- 546 • For GPU-accelerated rendering of large datasets, we will use **WebGL**
547 and related technologies such as **regl** or **Three.js**.

548 **Backend (Computation and Data Services).**

- 549 • The backend will be written in **Python**, using **FastAPI** or **Flask** to
550 serve data and model outputs to the frontend.
- 551 • Time series pre-processing, tiling, and downsampling will be handled
552 via **NumPy**, **Xarray**, and **Dask** to enable scalable, distributed pro-
553 cessing.
- 554 • For storage, we will use chunked, cloud-native formats such as **Zarr**
555 and **HDF5**, which allow efficient retrieval and hierarchical access to
556 long-duration recordings.
- 557 • Machine learning integration will rely on **PyTorch**, **scikit-learn**, and
558 model serving frameworks such as **TorchServe** or **ONNX Runtime**.

559 **Cloud Infrastructure.**

- 560 • The system will be deployable on commercial or academic cloud plat-
561 forms (e.g., AWS, GCP, or institutional clusters).
- 562 • For orchestration of services, we will use **Kubernetes**, enabling auto-
563 scaling and distributed deployment of visualization and ML services.
- 564 • **Docker** containers will ensure reproducibility and portability across
565 environments.
- 566 • The visualization system will integrate directly with the **DANDI Archive**
567 for cloud-native access to neurophysiology data.

568 **Data Interoperability.**

- 569 • All tools will be compatible with **Neurodata Without Borders**
570 (**NWB**) and follow FAIR data principles.
- 571 • The system will expose APIs for programmatic access to raw and
572 derived data, enabling integration with existing tools like **Bonsai**,
573 **CaImAn**, or **napari**.

574 This software stack ensures that our visualization tools will be perfor-
575 mant, scalable, and usable across a wide range of environments, from local
576 lab systems to cloud-based scientific platforms.

577 **3.4.3.4 Outputs**

- 578 1. visualisations for continuous behavioural and neural recording
- 579 2. visualisations for epoched behavioural and neural recording
- 580 3. visualisations for model outputs
- 581 4. indexing system to support intelligent visualisations
- 582 5. deployment of the above items to allow users to visualise NaLoDuCo
- 583 DANDI datasets on the cloud

584 **3.4.4 Offline spike Sorting**

585 **3.4.4.1 Outputs**

- 586 1. Repository with implementations and benchmarking of offline spike
- 587 sorting algorithms for long-duration recordings

588 **3.4.5 Online spike Sorting**

589 **3.4.5.1 Outputs**

- 590 1. Repository with implementations and benchmarking of online spike
- 591 sorting algorithms

594 3.5 Applicant and team capability to deliver

595 Word limit: 1,650

596 Why are you the right individual or team to successfully deliver the pro-
597 posed work?

598 What the assessors are looking for in your response

599 Please ensure the current job titles of the core team members are included
600 here to ensure eligibility can be established for the core team roles assigned.
601 Find out more about [UKRI's core team roles in funding applications](#) and our
602 [eligibility guidance](#).

603 Evidence of how you, and if relevant your team, have:

- 604 • the relevant experience (appropriate to career stage) to deliver the pro-
605 posed work
- 606 • the right balance of skills and expertise to cover the proposed work
- 607 • the appropriate leadership and management skills to deliver the work
608 and your approach to develop others
- 609 • contributed to developing a positive research environment and wider
610 community

611 You may demonstrate elements of your responses in visual form if rele-
612 vant.

613 Further details are provided in the Funding Service.

614 The word limit for this section is 1,650 words: 1,150 words to be used for
615 R4RI modules (including references) and, if necessary, a further 500 words
616 for Additions.

617 Use the *Résumé for Research and Innovation (R4RI)* format to showcase
618 the range of relevant skills you and, if relevant, your team (project and project
619 co-leads, researchers, technicians, specialists, partners and so on) have and
620 how this will help deliver the proposed work. You can include individuals'
621 specific achievements but only choose past contributions that best evidence
622 their ability to deliver this work.

623 Complete this section using the R4RI module headings listed. Use each
624 heading once and include a response for the whole team, see the UKRI guid-
625 ance on R4RI. You should consider how to balance your answer, and empha-
626 sise where appropriate the key skills each team member brings:

- 627 • contributions to the generation of new ideas, tools, methodologies, or
628 knowledge
- 629 • the development of others and maintenance of effective working rela-
630 tionships
- 631 • contributions to the wider research and innovation community
- 632 • contributions to broader research or innovation users and audiences
633 and towards wider societal benefit

634 Additions

635 Provide any further details relevant to your application. This section is
636 optional and can be up to 500 words. You should not use it to describe
637 additional skills, experiences, or outputs, but you can use it to describe any
638 factors that provide context for the rest of your R4RI (for example, details
639 of career breaks if you wish to disclose them).

640 Complete this as a narrative. Do not format it like a CV.

641 References may be included within this section.

642 The roles in funding applications policy has descriptions of the different
643 project roles.

644 **3.6 Project partners**

645 Add details about any project partners' contributions. If there are no project
646 partners, you can indicate this on the Funding Service.

647 A project partner is a collaborating organisation who will have an integral
648 role in the proposed research. This may include direct (cash) or indirect (in-
649 kind) contributions such as expertise, staff time or use of facilities. Project
650 partners may be in industry, academia, third sector or government organisa-
651 tions in the UK or overseas, including partners based in the EU.

652 If you are applying via the IPA or LINK scheme, please include details
653 of industry partners here.

654 If applying under the BBSRC-NSF lead agency scheme, please include
655 details of your US partner here.

656 Add the following project partner details:

- 657 • the organisation name and address (searchable via a drop-down list or
658 enter the organisation's details manually, as applicable)
- 659 • the project partner contact name and email address
- 660 • the type of contribution (direct or in-direct) and its monetary value

661 If a detail is entered incorrectly and you have saved the entry, remove the
662 specific project partner record and re-add it with the correct information.

663 For audit purposes, UKRI requires formal collaboration agreements to be
664 put in place if an award is made.

665 **3.7 Project partners: statement of support**

666 Word limit: 3,000

667 Only complete a statement of support if you have named project partners
668 in the project partner section above. A statement is required to be provided
669 from each partner you named in the ‘Project partners’ section.

670 If you are applying via the IPA or LINK scheme, please include details
671 of industry partner support here.

672 What the assessors are looking for in your response

673 A project partner is a collaborating organisation who will have an integral
674 role in the proposed research. This may include direct (cash) or indirect (in-
675 kind) contributions such as expertise, staff time or use of facilities.

676 Each statement should:

- 677 • confirm the partner’s commitment to the project
- 678 • clearly explain the value, relevance, and possible benefits of the work
679 to them
- 680 • describe any additional value that they bring to the project

681 Ensure you have prior agreement from project partners so that, if you are
682 offered funding, they will support your project as indicated in the ‘Project
683 partners’ section.

684 For audit purposes, UKRI requires formal collaboration agreements to be
685 put in place if an award is made.

686 Do not provide a statement of support from host and project co-leads’
687 research organisations.

688 Do not provide a statement of support from collaborators. Contributions
689 from collaborators not listed as project partners can be outlined in ‘Applicant
690 and team capability to deliver’.
